# ArcGIS Pro – Session One

# Creating Your First Map

The following step-by-step guide will help you to create a generic map using ArcGIS Pro (Pro), and some best practices for storing data, file management, and naming convetions.

During the process you will be making an Pro "Project". This Project will consist of several files and folders including a "File Geodatabase". You will create a "Feature Dataset" to store features. The Feature Dataset is nested inside of the File Geodatabase.

You will also find and download data using the internet. For Session One this original data will be in the form of a shapefile, which has become a Geographic Information System (GIS) industry standard file format. You will then "import" (copy) this data into the Feature Dataset that was created. Once that import is complete, the shapefiles become "Feature Classes", and along with that new designation, they gain some extra functionality that may be explored at a later time.

During this session, you will also be shown some styling options to help create a more meaningful graphic representation of your data. You will then create a Layout and be able to share this with others.

Please note that ArcGIS software updates regularly and images may not be completely accurate to your screen view. Every attempt has been made to make the images as accurate as possible.

Once installed, ArcGIS Pro Software is found in the Start Menu inside of a Folder titled ArcGIS.

1. Click once to open ArcGIS Pro.

2. Sign in with your ArcGIS Online account information. (usually - firstname.lastname).

ArcGIS Sign In

	Nebraska Game & Parks Commission <b>Open bata</b> Site Find authoritative spatial data related to conservation, fish and wildlife management, parks and outdoor

48. Scroll down the page and locate the "Parks" icon.

49. On the next page, click the orange text for State Park Areas.

50. Click the small download button to copy the data to your local machine. (76 records in this dataset)

 Perform the same download steps for "Nebraska State Trails". Go back one web page to find the layer, then click the orange text for Nebraska State Trails. (476 records in this dataset)

52. Copy the compressed files From your downloads folder into the folder we created called "Downloads for Session One". Remember that ArcGIS Pro is already connected to this folder.

Catalog Geopr 🖊 Edit Metadata

55. Expand the folders for Nebraska\_State\_Trails and State Park\_Areas as far as possible. Then, right-click on the files with extension ".shp" and choose, "Add To New Map" for the first .shp that you choose, then "Add to Current Map" for the second .shp file. The order in which you add these to a map does not matter.

56. The overall "Map View". Note: this is still the defaut projection and coordinate system – Can be changed in the Options like was done to change to a Dark Theme. We will change this Projection momentarily.

57. Right-click on the Feature Dataset created earlier. Then hover on "Import" and choose "Feature Class(es)".

58. Using the drop down arrows in the Geoprocessing tab, choose each of the Layers already added into the Table of Contents then click Run at the bottom right of the screen.

Geoprocessing	<b>-</b> ↓ ×

State_Park_Areas	- 🗁
	- 🗁
Output Geodatabase	
Session_One_Feature_Dataset	
	Run 🔹

59. Once the import process completes there will be two new "Feature Classes" inside the Feature Dataset. These are no longer 'shapefiles'.

60. Select both of these "Feature Classes" then right click and choose, "Add to New" – then choose Map.

61. Notice this Map View, "Map1", is projected and has those Feature Classes from the Feature Dataset. The Feature Classes inherit the Projection from the Feature Dataset.

62. Zoom to Fort Robinson State Park in the northwest portion of Nebraska. Notice there is already a 'Base Map' below the feature layers that have been added.

Also notice that the Area Feature of State\_Park\_Areas is below the lines of Nebraska\_State\_Trails. If we had added any point features they would have been placed above the lines. This is usually the order in which items are placed into the Table of Contents, but they can be rearranged as needed.

Please Note: Some items may be hidden from view if placed underneath other features in the Table of Contents on the left side of the screen.

63. Click the small colored square underneath the layer for "State\_Park\_Areas". A new tab on the right side of the screen will appear.

66. Notice the stroke style here for the trails layer has been altered to be a 'Multi-line' layer. This allows for a 'casing' to be displayed around each of the lines.

Again, clicking on Properties shows the various color schemes and overall appearance of the layer. Items such as Opacity and line thickness can be controlled. Or, click on Gallery and choose a preexisting style.

Experiment with the styling options of the layers.

Once you are satisifed with the color, thickness, and opacity you may save this to your 'Favorites' by clicking the 'Hamburger' icon at the right corner. Even unique color options can be saved to a color pallette and shared with others.

67. Select the Insert tab at the top near the left and choose "New Layout".

68. Pick a size for the finished artwork. This can be altered layer, if needed, but please note that any size can be printed 'to fit' any size of paper if needed.

		OK Cancel

70. Once the Layout View is created click Map Frame at the top.

71. Choose "Map1", not "Map" – While the layers are similar, they do not display the same data any longer. We have imported those layers to a new Feature Dataset and Geodatabase, and reprojected them, but this was done in the "Map1" Data Frame. We have also spent time styling those layers as needed.

72. Click and Drag a Box on the Layout View. Once you release the mouse button a general map will be placed. Do not worry about placement, size, or scale at this time. All of these properties can be adjusted later. For now we just need something on the Layout to work with.
